Aspergillus niger endoglucanase and cellulase I: purification, characterization and potential application in glucose production from sugarcane bagasse. A system for cellulase production in the oleaginous fungus *Aspergillus niger* was developed using a synthetic medium containing sugars extracted from sugarcane bagasse. The filamentous fungus produced a

cellulase-type enzyme complex exhibiting activity on crystalline cellulose. The two main enzymes, endoglucanase and exoglucanase, were produced together in large amounts and purified using a two-step process of ammonium sulfate fractionation and gel-filtration chromatography. The endoglucanase had a pH optimum of 5.5 and a temperature optimum of 50 degrees C, with the stability of the enzyme increasing with temperature. The enzyme has a molecular mass of 40.6 kDa, and showed maximum activity at 20 degrees C. The endoglucanase showed a broad pH optimum (5-9) and high stability. In the presence of 1% and 2% hemicellulose fractions, glucose yields of 44.3% and 47.7 77a5ca646e
