The Altair 8800 is a programmable computer from Hewlett Packard. Like most early programmable computers, it was highly innovative for its day, and it proved popular with hobbyists. One of the many things it was especially good at was graphics. It could not only draw shapes on the screen, but it was also capable of generating graphics by hand. Altair graphics are the graphical results of Logo, an early programming language designed to be used on the Altair and on other Hewlett-Packard computers. It is very likely that you are most familiar with Logo from the Apple II, Commodore 64, or Atari 400/800 video game consoles. It has long served as the base language for programming microcontrollers. FEATURES:- The most complete example of programming with an 8-bit computer and CPU.-- Computer capable of displaying geometric forms using line and filled patterns and cylinders and cones.- The original code and forms in assembly language. Note: This computer did not have a terminal attached and the main output and display was on the cassette tape. The code was displayed on the internal binary display screen (the monochrome green display with a small grid). The forms were displayed on a TV set connected to the computer.-- Up to 50 types of shapes. All sets are available on tape/disk or removable cassette. Format disk: [Name of the shape type]@[filename]-- In addition to the basic 32 cubic and 23 prismatic shapes (cube) you can draw forms made up of triangular, hexagonal, pentagonal, pentagonal and heptagonal shapes (cylinder and cone). All shapes have two optional colors-- The first shape appears in a solid square and can be edited by clicking on a separate square on the screen. By pressing the HOME key you can use it as a mouse to place a new shape on the screen. The mouse can be moved by holding the left mouse button and moving the mouse. Clicking inside the square places a new shape. Repeatedly clicking on the mouse within the square will change the position of the shape.-- So you have an endless number of patterns for shapes with colors. Shape number six is a colored pyramid. However the form with only one shape is only available on the program disk.-- Approximately 270 variable names are used to interact with the forms in the shape tape. FLAT FORM EXAMPLE:-- A rectangle with 7 sides and a colored triangle with a yellow square in the middle.-- If the shape is put on the tape and analyzed for the 09e8f5149f
